

Regression Model Conclusion

Three regression algorithms were trained and evaluated to predict house prices:

- Linear Regression
- Decision Tree Regressor
- Random Forest Regressor

The models were compared using:

- Mean Absolute Error (MAE)
- Mean Squared Error (MSE)
- Root Mean Squared Error (RMSE)
- R^2 Score

The model with the highest R^2 score and the lowest prediction error was selected as the best-performing model.

The Random Forest feature importance analysis also identified the variables that contribute most to predicting house prices, providing valuable business insights for stakeholders.
